

# RMFT-L

## RepliWeb Managed File Transfer Lite

### RepliWeb Managed File Transfer Lite (RMFT-L) offers simplified, secured, web-based file exchange.

Addressing the needs of organizations seeking to replace FTP, RMFT alleviates common FTP administration pains by centrally managing user accounts and upload/download operations from an intuitive, GUI-based management console. Unlike standard FTP solutions, RMFT offers industry-leading features like auditing, package expiration, and notification. End users are presented with a familiar web UI, allowing for secure seamless file transfers.

#### RMFT Lite Topology

#### Web-based File Transfer Process

1. Sender upload files via Web UI
2. Email sent to recipient with link to files
3. Recipient downloads files via Web UI
4. Sender receives notification of download

#### What drives the need to adopt RepliWeb Managed File Transfer Lite?

- **Reducing IT Workload** – Manually creating users, managing access permissions and securing the system from external and internal threats can be difficult and time-consuming. RMFT alleviates these issues by providing a centralized, efficient means for provisioning user accounts, restrictions and capabilities.
- **Improving End User Experience** – Not all end users are savvy enough to download and install an FTP client and use it effectively. Their needs are simple—they're looking for an intuitive, clientless, web-based solution that will enable them to quickly and easily send, track and receive file transfers from coworkers and business partners.
- **Security Concerns** – Unlike standard FTP, RMFT offers the ability to encrypt the transfer session via HTTP/S, and the ability to recover transfers from a previous point of failure.

Organizations, regardless of size, will recognize significant productivity and security gains by incorporating RepliWeb Managed File Transfer into their file exchange architecture.

#### Business Benefits

- Provide a friendly end-user experience for file exchange
- Minimize IT workloads associated with file transfers
- Enable efficient exchange across organizations
- Enforce responsible file exchange practices

#### Key Features

- Consolidate file transfer processes under one managed solution
- Active Directory integration for user creation
- Ad-hoc (on the fly), policy-based user creation
- Configurable send / receive restrictions
- Flexible, automated package expiration
- Comprehensive auditing and notification
- Web based (HTTP/S) interface or rich web client
- Guarantee delivery with recoverable transfers
